Comparison April 16, 2021 - April 15, 2022

Summary of the Fundamental and Technical Analysis

- The negative earnings revisions trend is specific to the stock.
- In terms of valuation, the stock has very poor potential.
- The negative technical trend goes along with the aggregate: the pressure is systemic.
- The stock showed a four weeks relative overperformance in a negative environment Technology.

Checklist

Nyon, 16-Apr-2022 06:30 GMT+1

Global Evaluation	Downgrade from neutral to slightly negative the 15-Apr-2022.
Interest	★★★★★ Very weak interest since 15-Apr-2022.
Earnings Rev Trend	★ Analysts neutral but previously negative (since 01-Apr-2022)
Valuation Rating	★ Strongly overvalued
MT Tech Trend	★ Trend negative since 15-Apr-2022
4wk Rel Perf	★ vs. SP500
Sensitivity	↔ Decrease from high to moderate the 23-Jul-2021.

Fundamental and Technical Analysis

Price Level Analysis ★

In order to assess whether APPLE is currently fairly priced, we can combine Peter Lynch's broadly accepted methodology, comparing the projected earnings growth and dividends to the estimated PE ratio, with historic multiples. Based on this,

- APPLE appears fundamentally very overvalued compared to its theoretical fair price.
- its valuation is less attractive than the American Technology aggregate.

The fundamental price potential for APPLE looks rather low, with other stocks in the same industry showing significantly better theoretical valuations.

Earnings Revisions ★

APPLE is strongly followed by financial analysts, as over the last three months an average of 41 analysts provided earnings estimate forecasts up until the year 2023. Currently, these analysts are slightly lowering their earnings growth estimates (0.0%) compared with seven weeks ago. This negative pressure on the growth expectations has been continuous over the past 12 months.

The positioning of APPLE vs. its reference sector Technology accentuates that the negative earnings revision trend is a problem specific to the stock, because its environment is - on the contrary - being positively revised.

Technical Trend and relative Performance ★★

The stock has been in a medium-term down trend, which started on April 15, 2022, at a price of USD 165.29. Its adjusted technical reverse point is USD 171.70, or 3.9% above the current price.

The four-week dividend-adjusted relative performance against the reference index SP500 is 3.5%.

The technical trend must be overshadowed by this overperformance, a sign that the investors are still interested in this stock.

The four-week relative performance of its reference group Technology is negative.

Dividend

The 12-month indicated dividend yield is 0.6%. This estimated dividend represents 14.8% of the estimated earnings. Consequently, the dividend is easily covered, and very likely to prove sustainable.

Price & Sensitivity Evolution

Sensitivity Profile

Sensitivity Analysis

Beta, Correlation and Volatility

A Beta of 1.24 indicates that for 1% of index variation, APPLE varies on average by 1.24%. But a Beta analysis coupled with the correlation gives a more relevant assessment.

Correlation is the degree of similarity in which a stock fluctuates in relation to its reference index. APPLE has a correlation rate of 0.74. This indicates that 74% of the stock's movements are explained by index variations. APPLE is strongly correlated to SP500.

The volatility is also used as a sensitivity factor. The 1 month annualized volatility of APPLE is : 26.0%, that of the index SP500 is 14.2% and that of the world aggregate for the group Technology is 23.6%. By comparison, the average volatility of the stocks that make up the reference index is practically identical at 27.1%.

Sensitivity to Bear Markets

The Bear Market Factor measures the behavior of a stock in declining markets. Thereby APPLE tends to drop in the same proportion as the SP500 index. Hence, we observe a market typical behaviour during market declines.

Sensitivity to Bad News

The Bad News Factor measures negative swings of a stock in rising markets. In the case of specific pressure, APPLE is only moderately sanctioned by the market in most of the times. When the stock goes down in a rising environment, its average deviation is -1.25%.

Summary of the Sensitivity Analysis

By comparing with other stocks, the sensitivity of APPLE has been medium and this since July 23, 2021.

Conclusion

At the analysis date of April 15, 2022, the impression that the fundamental and technical elements (valuation, earnings revisions, group benchmarking, technical factors) give is negative.

Moreover, the combination of the different criteria of sensitivity appreciation leads to a qualification of medium sensitive.

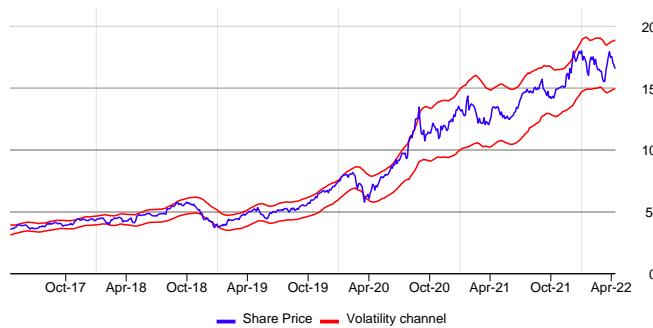

By combining the negative fundamental and technical analysis, with the moderate sensitivity, the general evaluation seems slightly negative.

Glossary - Equities

Global Evaluation

The rating results from several factors : fundamental and technical analysis, measure of sensitivity and benchmark trend.

The synthesis is rated on a 5 level scale:

- : Positive
- : Slightly positive
- : Neutral
- : Slightly negative
- : Negative

The synthesis for the Indices and Industries is rated on a 3 level scale: Positive, Neutral and Negative.

Number of Stocks

The number of stocks in the index that can be analyzed.

Mkt Cap in \$bn

This number represents the Market Capitalization in USD bn. It is calculated by multiplying a firm's share price by the number of outstanding shares. For reasons of comparison, all results are in USD.

Valuation Rating

Our Valuation Rating indicates if a stock is "expensive" or "cheap" relative to its growth potential. This is used to determine whether or not the investor is paying a premium for anticipated growth.

To estimate a stock's value relative to its current price, our Valuation Rating combines:

- stock price
- projected earnings
- projected earnings growth
- dividends

We establish our rating by combining these elements.

There are five ratings, ranging from strongly undervalued to strongly overvalued .

Stars

theScreener.com's star rating system is designed to enable you to identify high-quality stocks quickly and easily.

In this easy-to-use rating system, stars are earned for each element specified below:

- Earnings Rev Trend = ★★★★
- Valuation Rating , , = ★★★★
- MT Tech Trend = ★★★★
- 4 week Relative Performance > 1% = ★★★★

Therefore, a stock can earn a maximum of four stars.

The lowest rating a stock can have is no stars.

Once a stock has earned a star, it will keep it until:

- Earnings Rev Trend becomes negative
- Valuation Rating becomes negative ,
- MT Tech Trend becomes negative
- 4 week Relative Performance drops below -1% (<-1%)

Div

This is the dividend in % for the next 12 months.

Even if the same number is shown, the dividend value can appear in one of four colors, depending on the earnings coverage:

- 0%, no dividend
- %, the dividends are covered (between 0% and 40% of earnings)
- %, the dividends represent between 40% and 70% of earnings
- %, the dividends are higher than 70% of earnings, which implies that the dividend coverage is not guaranteed.

Earnings Rev. Trend

The symbol shows that compared with their earnings revisions of seven weeks ago, the analysts have now raised their estimates (7wk EPS Rev; > 1%); the symbol indicates that compared with their earnings revisions of seven weeks ago, the analysts have now lowered their estimates (7wk EPS Rev < -1%).

When the earnings revisions (7wk EPS Rev) fall between +1% and -1%, the trend is considered to be neutral .

The symbol indicates that the last significant revisions have been trending positive.

The symbol indicates that the last significant revisions have been negative.

7wk EPS Rev

This is an abbreviation for 7 week Earnings Per Share Revision. This column indicates the value of these revised earnings. A figure of 2.8 signifies that compared with seven weeks

ago, the analysts have now revised and raised their estimates by 2.8%. On the contrary, a negative number means that the earnings would have been revised lower.

G/PE Ratio

In order to establish our Valuation Rating, we calculate the estimated growth of future earnings (LT Growth) plus dividend in %, divided by the estimated future PE ratio (Long Term P/E).

LT PE

This is the relationship between the price (P) and the estimated long-term future earnings.

LT Growth

This is the estimated annual growth rate of future earnings, normally projected over the next two to three years.

MT Tech Trend

The MT Tech Trend indicates the current trend, positive or negative , and the Tech Reverse indicates up to which price this trend will remain valid.

When a price falls to 1.75% above or below the Tech Reverse, the MT Tech Trend is considered neutral .

Once the price breaks out of the +1.75% neutral zone, the MT Tech Trend will change to positive.

The symbol indicates that the previous MT Tech Trend was positive.

The symbol indicates that the previous MT Tech Trend was negative.

4wk (Rel) Perf.

This figure measures the dividend-adjusted performance of a stock relative to its national or regional index (compared to four weeks ago). As for an Index, it measures the net performance over 4 weeks.

Bad News Factor

To determine the "Bad News Factor" we analyze a stock's declines in rising markets. In this purely objective analysis, the actual reasons for a stock's behavior are not important. If a stock price falls while its relative index goes up, it can be assumed that the stock's performance has been affected by bad news - hence the name, "Bad News Factor".

Here a stock's movements are measured on a bi-weekly basis, during a sliding 52 week period. Every time a stock drops while its reference index rises, the difference is calculated in %, integrated into a yearly average and expressed in basis points.

The higher the "Bad News Factor," the more a stock has proven to be sensitive to bad news. The lower the "Bad News Factor," the less the stock has proven to be sensitive to bad news.

Bear Market Factor

To determine the "Bear Market Factor" we analyze a stock's price movements in declining markets.

This is the analysis of the movements, in a bi-weekly intervals, during a sliding 52 week period. The higher the "Bear Market Factor," the greater the probability a stock would drop when its relative index drops.

A "Bear Market Factor" that is strongly negative means the stock has been more resistant to losses in declining markets.

Sensitivity

Stock price developments are generally volatile and contain high risks that can result in a total loss. Based on a their historical behaviour, stocks are classified by sensitivity level. These sensitivity levels have to be considered solely in relative historical comparison to other stocks. Please note that even "Low Sensitivity" stocks are equities and therefore high risk investments that can lose up to all of their value, and that past performance is no indication of current or future performance.

"Sensitivity" is determined by measuring the "Bear Market Factor" and the "Bad News Factor" against its benchmark.

There are three grades of sensitivity levels:

- Low Sensitivity: The sensitivity indicators fall below the world reference average.
- Moderate Sensitivity: The sensitivity indicators are situated higher than the world reference average, but lower than standard deviation.
- High Sensitivity: The sensitivity indicators are at levels higher than standard deviation.

Volatility 12 M

Volatility measures the magnitude of upwards and downwards movements of a stock or index. The volatility 12 M shows the average volatility over the last 12 months.

% of Stocks in Uptrend

This is the percentage of stocks in a given list that have a positive Medium Term Technical Trend. If, for example, the aggregate of Technology / World, (which is made up of 458 stocks) has 8% "of stocks in Uptrend," it means that 38 of the stocks within that aggregate have a positive Medium Term Technical Trend.

Beta

Beta is often used as a measure of sensitivity. Where a Beta is greater than 100, the stock is more volatile than its reference index.

Correlation

Correlation is the degree of similarity in which a stock fluctuates in relation to its reference index.
